

TU-1 and TU-2 Thumbs-Up Factory Reset

Thumbs-up Factory Reset. For NTSC press the T and Thumbs Up buttons down together for Three seconds. This will completely clear the memory. If you are using Thumbs Up in the PAL environment use T and Thumbs Down buttons together for three seconds.

Why must I perform the Factory Reset?

The NVRAM is susceptible to power spikes and fluctuations. Even to spikes in the video and audio signal lines caused by incorrect voltages or static electricity discharge (very rare).

If you have to perform a Factory Reset, it is wise to examine the cause. Some do's and don'ts:

- If the unit is plugged into a power strip, never apply or remove power from the unit using the switch on the power strip.
- Never remove power to the unit without first pressing the "Power" key on the keyboard or front panel
- If the power in your area is unstable or your lights dim and grow brighter on occasion, it is wise to invest in a power conditioner or UPS (Uninterruptible Power Supply).
